Publicity

Covering Letter

Dear Editor:

As you probably know, air pollution regulations have been issued which restrict the type and amount of solvents, other than water, that can be used in paint and coatings.

The California Air Resources Board (CARB), which has been in the forefront in developing regulations of this type, has taken the practical step of trying to determine whether it is possible for all major types of architectural coatings on the market to meet these strict requirements and yet demonstrate competitive performance vs equivalent conventional paints and coatings. They have contracted with the D/L Laboratories to assist them in this program.

Our first approach is to publicize their interest as widely as possible in order to alert manufacturers of these products as to CARB's interest. Commercial or prototype samples of these products will then be compared with equivalent conventional products by us.

We would therefore appreciate your inserting the enclosed Publicity Release in an early issue of your publication. If and when you do, please send us two copies of the item.

Thank you for your cooperation.

Sincerely,

Sidney B. Levinson
President

Publicity Release

CARB SEEKS ACCEPTABLE COATINGS

The California Air Resources Board (CARB), as part of their research program to investigate the current status of coating technology, is seeking commercial paints and coatings which meet CARB solvent limitation requirements. Consequently, CARB has contracted with the D/L Laboratories to locate and investigate the relative performance of commercial field applied products which contain less than 250 gm of volatile organic material (e.g., solvent) per liter of paint (excluding water) and which exhibit competitive performance to conventional products.

These paints and coatings are as follows:

1. Clear Finishes, e.g., varnish, lacquer (brushing), shellac
2. Wood Stains - semi-transparent type, either interior or exterior
3. Wood Stains - opaque type (heavy bodied)
4. Primers, Sealers or Undercoaters
5. Penetrating Wood Preservatives
6. Fire Retardant Coatings - Flame spread of 25 or less
7. Tile-like (high build) Glaze Coatings
8. Waterproofing Coatings, e.g., roof coatings, concrete waterproofing
9. Industrial Maintenance Topcoats
10. Metallic (e.g., aluminum) Coatings
11. Swimming Pool Paints
12. Graphic Arts Coatings, e.g., sign paints, bulletin boards

116 East 16th Street, New York, N.Y. 10003

13. High Build Mastic Coatings, e.g., texture paint, at least 15 mils thick
14. Multicolor Paints
15. Aerosol Spray Paints

These paints and coatings may be either water-base or high solids provided that they are similar to the equivalent competitive products in package qualities, application properties, appearance and performance. The water-base coatings may contain any organic solvents, provided that the total volatile organic material is less than 250 gms per liter of paint (excluding water). It is not necessary that the solvents meet the requirements of Rule 66 or its variation.

Your cooperation in obtaining this information is solicited. If you have any of the above products, either on the market or in preparation for marketing, please call or write to:

Questionnaire

Covering Letter

Dear Sir:

The California Air Resources Board (CARB), as part of their research program to investigate the current status of the technology, is seeking commercial paints and coatings which meet CARB solvent limitation requirements. Consequently, CARB has contracted with the D/L Laboratories to locate and investigate the relative performance of commercial field applied products which contain less than 250 gm of volatile organic material (e.g. solvent) per liter of paint (excluding water) and which exhibit competitive performance to conventional products.

These paints and coatings are as follows:

1. Clear Finishes, e.g., varnish, lacquer (brushing), shellac
2. Wood Stains - semi-transparent type, either interior or exterior
3. Wood Stains - opaque type (heavy bodied)
4. Primers, Sealers or Undercoaters
5. Penetrating Wood Preservatives
6. Fire Retardant Coatings - Flame spread of 25 or less
7. Tile-like (high build) Glaze Coatings
8. Waterproofing Coatings, e.g., roof coatings, concrete waterproofing
9. Industrial Maintenance Topcoats
10. Metallic (e.g., aluminum) Coatings
11. Swimming Pool Paints

116 East 16th Street, New York, N.Y. 10003

-5-

12. Graphic Art Coatings, e.g., sign paints, bulletin colors
13. High Build Mastic Coatings, e.g., texture paints, at least 15 mils thick
14. Multicolor Paints
15. Aerosol Spray Paints

These paints and coatings may be either water-base or high solids provided that they are similar to the equivalent competitive products in package qualities, application properties, appearance and performance. The water-base coatings may contain any organic solvents provided that the total volatile organic material is less than 250 gms per liter of paint (excluding water). It is not necessary that the solvents meet the requirements of Rule 66 or its variations.

If you have any of the above products, either on the market or in preparation for marketing, will you please submit as much as you can of the information requested on the enclosed form. Use a separate form for each product you have to offer. More forms are available on request or you can duplicate them, if you prefer to do so.

We solicit your cooperation in obtaining this information and look forward to your reply.

Sincerely,

Sidney B. Levinson

Letter to Raw Material Suppliers

Re: California Air Resources Board (CARB)

The enclosed letter has been sent to major paint and coating manufacturers throughout the continental U.S.A. and to all paint manufacturers of any significant size in California.

Have you developed any coatings on the enclosed list which meet CARB requirements? If so, is any paint manufacturer presently either marketing or getting ready to market a similar product? In that event, will you either forward the enclosed information to him or advise us and we will do so.

We also would appreciate your sending us whatever literature is available on the products you have developed that are on the list and conform to the CARB requirements.

Sincerely,

Sidney B. Levinson
President

Revised Covering Letter

The California Air Resources Board (CARB), as part of their research program to investigate the current status of coating technology, is seeking commercial paints which meet CARB solvent limitation requirements. Consequently, CARB has contracted with the D/L Laboratories to obtain and test the following products which contain less than 250 gm of volatile organic material (e.g., solvent) per liter of paint (excluding water) and which are competitive to conventional paints.

1. Clear Finishes
2. Wood Stains - semi-transparent and /or opaque
3. Primers and/or Undercoaters
4. Penetrating Wood Preservatives
5. Fire Retardant Coatings
6. Tile-like (high build) Glaze Coatings
7. Waterproofing Coatings, e.g., for roofs or concrete
8. Industrial Maintenance Topcoats
9. Aluminum Paints
10. Swimming Pool Paints
11. Sign Paints or Bulletin Colors
12. High Build Mastic Coatings, e.g., texture paints
13. Multicolor Paints

116 East 16th Street, New York, N.Y. 10003

-10-

These paints and coatings may be either water-base or high solids, provided that they are competitive to the equivalent conventional products. The water-base coatings may contain any organic solvents provided that the total volatile organic material is less than 250 gms per liter of paint (excluding water).

If you have developed any of these products, will you please send us a quart sample and any data that you have on the product(s).

We solicit your cooperation in obtaining this information and look forward to your reply.

Sincerely,

Sidney B. Levinson
President

Appendix III

TEST PROCEDURE

The following test methods were used, except as noted in the test conducted:

ASTM D ---- refers to methods described in Part 27 "Paint - Tests for Formulated Products and Applied Coatings" issued by the American Society for Testing and Materials, Philadelphia, PA. Method ---- refers to tests described in Federal Standard No. 141A "Methods for Testing of Paint, Varnish, Lacquer and Related Materials" issued by the General Services Administration, Washington, DC.

Other tests are described.

Package Qualities

1. Viscosity: -

a) Pigmented Paints: -

Unit - KU

ASTM D-562 "Consistency of Paints Using the Stormer Viscometer"

b) Clear Liquids: -

Unit - G/H

Method 4271 "Viscosity of Transparent Liquids (Gardner Tubes)"

2. Viscosity Stability: -

Unit - KU or G/H

ASTM D-1849 "Package Stability of Paint". Viscosity was redetermined after storage.

3. Storage Stability: -

Unit - Score

ASTM D-1849 "Package Stability of Paint"

4. Pot Life: - Unit - Hours

Eight ounces (8 oz) of the multi-component products were mixed in accordance with the supplier's instructions. They were periodically checked for workability. The same test was conducted with the powder paints after mixing with water.

Application

5. Drying Time: - Unit - Hours

ASTM D-1640 "Drying, Curing or Film Formation of Organic Coatings at Room Temperature"

6. Application Ease: - Unit - Score

The coating was brush-applied to an appropriate substrate and scored for relative ease of application. Sample Nos 4-43, 14-1 and 14-2 had to be spray-applied. Note: All multicolor paints (Class 14) are sprayed.

Coating Appearance

7. Gloss: - No Unit

ASTM D-523 "Specular Gloss"

8. Opacity: - Unit - %

ASTM D-2805 "Hiding Power of Paints"

9. Enamel Holdout: - Unit - %

The test primer was dried for 24 hours. An enamel was then applied on the primer and allowed to dry for 24 hours. The gloss of the enamel was then determined in accordance with ASTM D-523 (see above).

$$\text{Enamel Holdout (\%)} = \frac{\text{Gloss on Primer}}{\text{Gloss on Sealed Surface}} \times 100$$

10. Bleeding: - Unit - Score

The test primers were applied on red cedar and dried for one week. The relative degree of staining caused by bleeding from the cedar was observed and scored.

11. Appearance: - Unit - Score

The multicolor paints (Class 14) were compared for relative appearance and definition of the multicolor pattern.

Coating Performance

12. Adhesion: - Unit - %

ASTM D-3359 "Measuring Adhesion by Tape Test"

13. Flexibility: - Unit - Inch

ASTM D-1737 "Elongation of Attached Organic Coatings with Cylindrical Mandrel Apparatus"

14. Taber Abrasion: - Unit - mgm

Federal Method 6192 "Abrasion Resistance (Taber Abraser)"

15. Water Absorption: - Unit - %

Preweighed appropriate substrate specimens were coated with the test paint and dried for one week. Groups 2 and 3 were tested on wood and submerged for 30 minutes. Groups 8 and 13 were tested on concrete and submerged for 72 hours. The panels were then wiped to remove excess water and reweighed.

$$\text{Water Absorption (\%)} = \frac{\text{Gain in Weight}}{\text{Weight before Immersion}} \times 100$$

16. Immersion Resistance Tests: -

The following tests were conducted with completely coated substrate specimens partially immersed:

Cold water

Xylol (Xylene)

Mineral spirits

Alcohol (100%)

Coatings which withstood the maximum period of exposure were evaluated for -

Blistering - ASTM D-714 "Evaluating Degree of
Blistering of Paints"

Color change - Score

Gloss change - Score

Hardness - Initial and after recovery for
24 hours - Score

Coatings which failed prematurely were removed and the time until failure was recorded.

17. Spot Resistance Tests: -

The following tests were conducted by placing 1 mm of reagent on the test coating and keeping it covered to prevent evaporation.

Hot water

Alcohol (50%)

Butyl acetate

Hydrochloric acid (HCl) - 50% solution

Where possible, the coatings were evaluated as described in No. 16 above. If not, the time until failure was recorded.

Exposure Resistance

18. The coatings were exposed to ultraviolet light for two weeks and then compared with the unexposed coatings for -

Gloss Retention (change in gloss) Unit - Score

Color Retention (change in color) Unit - Score

19. Salt Fog (Corrosion Resistance): -

ASTM B-117 "Salt Spray (Fog) Testing"

Duplicate coated panels were exposed. Before exposure, the panels were scored with an "X" to expose the steel. Panels which withstood a minimum of 500 hours of exposure were evaluated as follows:

Blistering - overall and along the "X"

ASTM D-714 "Evaluating Degree of Blistering of
Paints"

Corrosion after stripping the paint - Score

Creep of corrosion from the "X" - mm

Panels which failed before the maximum period were removed and the time of exposure recorded.

20. Accelerated Weathering: -

ASTM G-53 "Recommended Practice for Operating Light and Water Apparatus for Exposure of Non-metallic Coatings"

Duplicate panels were exposed. Panels which were exposed for at least 500 hours were evaluated for the following changes -

Color change - Score

Gloss change - Score

Chalking - ASTM D-659 "Chalking of Exterior Paints"

Checking - ASTM D-660 "Checking of Exterior Paints"

Cracking - ASTM D-661 "Cracking of Exterior Paints"

Panels which failed prematurely were removed and the time of exposure recorded.

Score: -

The scoring system used was that developed by ASTM:

<u>Score</u>	<u>Performance</u>	or	<u>Effect</u>
10	Perfect		None
9	Excellent		Trace
8	Very good		Very slight
6	Good		Slight
4	Fair		Moderate
2	Poor		Severe
0	No value		Failed
